Area of Operations

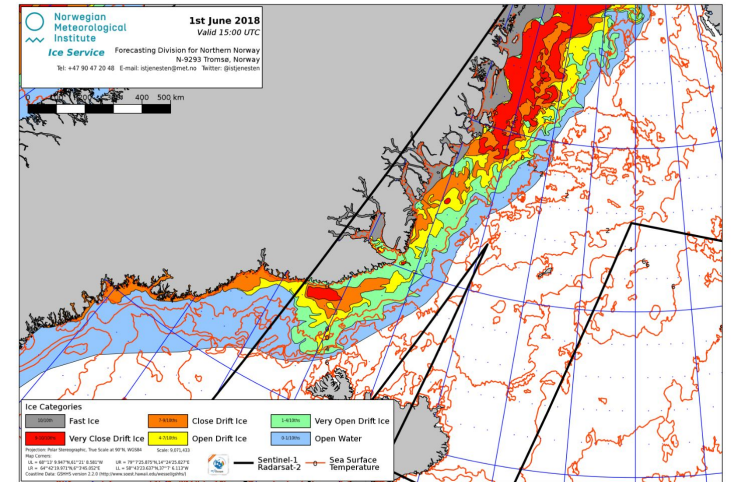

Area of Operations

Office staffed 7 days/week

Regional updates: 2-4 times/week

Daily charts: Monday - Friday

Polar Expedition Cruise Participation and Assistance

MET Norway -

2017 - *Midnatsol* Hurtigruten, Chilean Fjords and Antarctic Peninsula

2017 - *50 Years of Victory*, Murmansk to the North Pole

2017 - National Geographic, Svalbard and Greenland

2018 - Seabourn, Antarctic Peninsula and Antarctic Sound

DMI -

2017 - Contract on services to Greenland Pilot Service

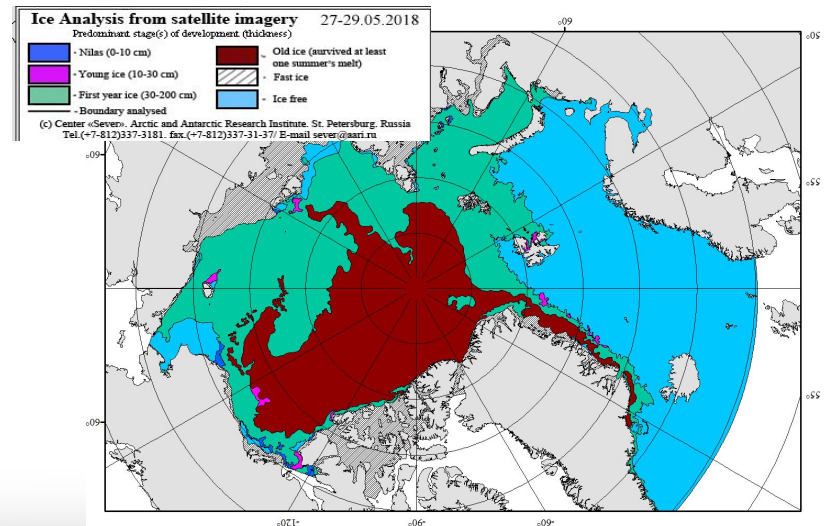

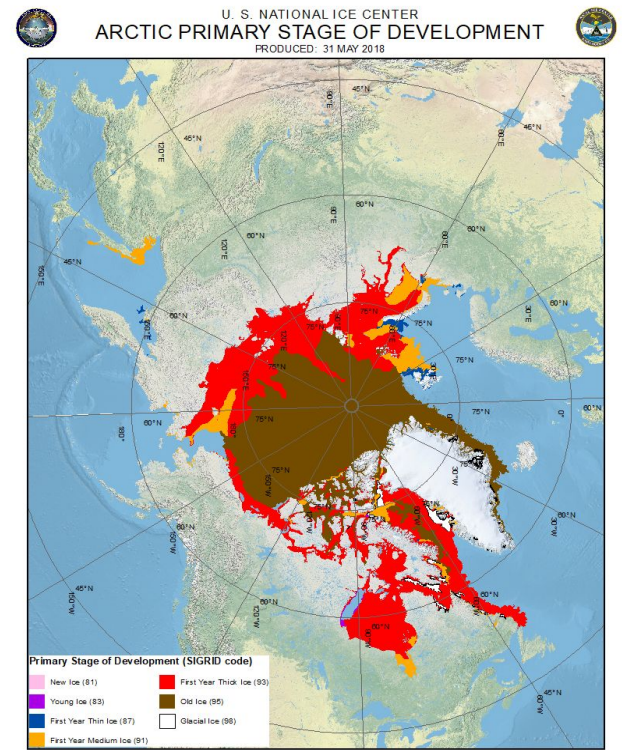

2018 - AECO / IAATO Collaboration

2018 - Mary Arctica, Antarctica

Research Opportunities and Citizen Science

- **Polar tourism are one of the best sources for in situ ice observations for operations because:**
 - Travel on routine transects to our areas of interest
 - Passengers who go on these ships are interested in these extreme environments and want to understand how we connect science observations with the big picture

Challenges

- **Challenges with the use of satellites for sea ice**
 - *Limited SAR coverage (space/time), resolution not sufficient for smaller ice and icebergs (size/shape)*
 - *Useful to have some information going back to Ice Services*
- **Coordination of citizen science activities with ice services**
- **Quality control of ice information from shipboard observations**
 - *Need for standardization in images*
- **Frequency of observations for ice services**
 - *Ice charts need to be available at a specific time of the day*
 - *Ship may not be in or near ice all the time so it's difficult to plan for acquisition*
- **Resources available to support citizen science initiatives**
 - *Little resources from ships during short trips for efficient data exchange*
- **Provision of tailored support**
 - *Problem with timing of ships location, data acquisition and bandwidth issues at high latitudes or in fjords*
- **Lack of time from crew/expedition personnel**

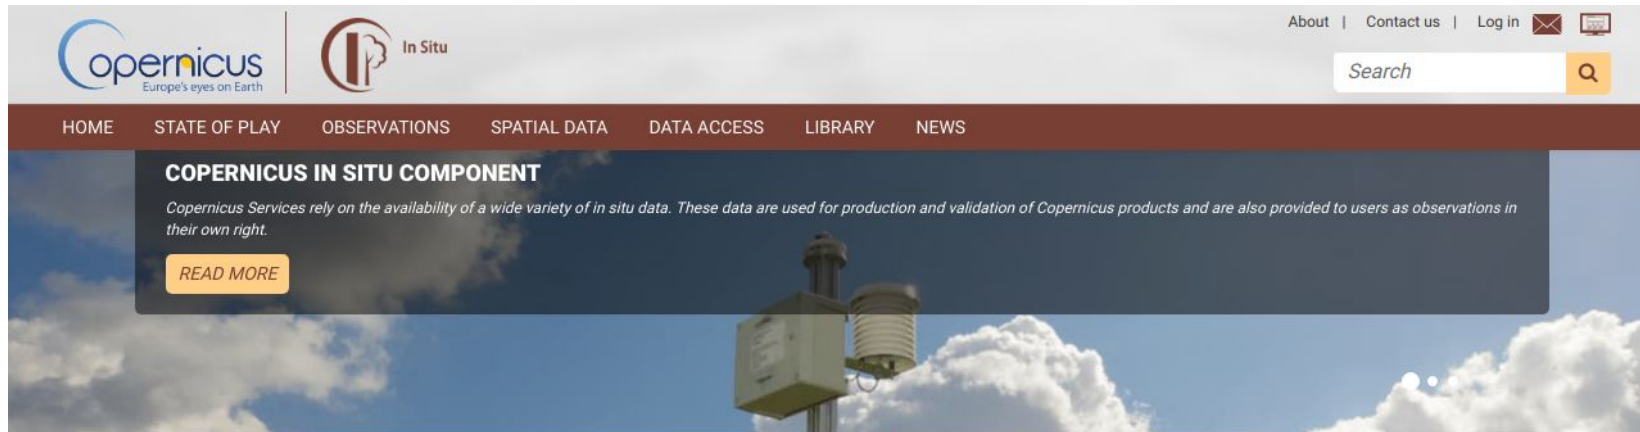

Example of observations for ice thickness

Figure 5: Painted pole used to aid eye in estimating ice thickness. Thanks Lauren Farmer and Alex Cowen.

COPERNICUS Services

EXPLORE THE COPERNICUS IN SITU COMPONENT

Copernicus is the European Union's revolutionary Earth Observation and monitoring programme. Copernicus offers a world of insight about our planet to European and global citizens, public authorities, policy makers, scientists, entrepreneurs and businesses. Copernicus is openly and freely available to everyone at no cost.

Copernicus transforms information from multiple sources, including satellites, into operational services for keeping watch over the planet Earth's land, ocean and atmosphere, monitoring climate change, supporting European emergency management and safeguarding civil security.

The Copernicus Services rely on many environmental measurements collected by data providers external to Copernicus, from ground-based, sea-borne or air-borne monitoring systems, as well as geospatial reference or ancillary data, collectively referred to as "in situ" data.

The Copernicus In Situ Component maps the landscape of in situ data availability, identifies data access gaps or bottlenecks, supports the provision of cross-cutting data and manages partnerships with data providers to improve access and use conditions.
